There are no financial conflicts to disclose.

Acknowledgements
I would like to thank Alyssa DelVaglio Lindsay, Gaspervitch, and Melissa Nelson for contributing to this presentation.

What’s the problem?

Teachers spend many hours with children who experience anxiety and depression.
Teacher perceptions about mental health disorders influence their ability to support students (Blain-Arcaro et al., 2012; Whitley, Smith & Vallance, 2013).
Yet, studies worldwide reveal that teachers lack preparation to identify or support students with "internalizing disorders" (Andrews, McCleer, & Wildmen-Johnston, 2014; Brown, Delbach, & Speakman-Barnes, 2006; Miller, Tahe, & Jensen, 2012; Rieker, Starnes, Herman, Furi, & Gsel, 2011; Viera, et al., 2014).
Other barriers

- Teachers are under stress; your request may add to their workload.
- Teachers may be reluctant to sacrifice their only hour away from students to return your call or fill out your forms.
  - “In APRIL? REALLY?! Don’t they understand what April is like in schools??”
  - “It would take me an hour to figure out what half this questionnaire even means.”

So, if we want to collaborate with teachers on patient care, what can we do?

1. Get releases of information
2. Use common language
3. Ask about context-relevant symptoms
4. Suggest classroom-friendly interventions

1. Get releases of information

Add a note that tells the teacher how and when to reach you.
2. Use common language: A little quiz

- The eligibility criteria for special education services for students with emotional disorders are directly aligned with the DSM-V criteria.
- The eligibility criteria are updated each time the DSM criteria are revised.
- Neither of the above.
- Both of the above.
- The eligibility criteria are based on the findings of a joint commission on mental health and education which meets every four years.

In order to be certified as a teacher to work in any Pennsylvania public school, a teacher must complete:

- An on-line course on the major mental health disorders in children and adolescence.
- Formal coursework on abnormal psychology.
- A licensing examination that includes mental health content questions.
- No formal coursework on mental health.

3. Ask about context-relevant symptoms.

- Teachers lack understanding of mental health disorders (Andrews, McCabe, & Wakeen-Johnston, 2014; Brown, Dahlbeck, & Sparkman-Barnes, 2006; Miller, Taha, & Jensen, 2012; Reinke, Stormont, Herman, Puri, & Goel, 2011).
- Related to suicide, Scouller & Smith (2002) reported:
  - Only 47% of teachers identified specific behavioral warning signs.
  - Only 51% understood the link between psychiatric disorders and suicide; 73% discounted this connection.
- Structured checklists and scales can help, but these may overlook important teacher observations (See Tobin & House, 2015).

What classroom-context symptoms can teachers observe?

- School avoidance or truancy
- Lower academic performance
- Irritability
- Social withdrawal
- Acting out general disruptions
- Inability to cope with stress or certain situations
- Sleepiness; lack of energy

(Source: 2005, March, 2006)
What do anxiety and depression look like in the classroom?

Low academic performance; academic performance gradually declining
- Preoccupation with talking about academic performance
- School/task avoidance: Students may skip school/class to avoid taking an exam or avoid social interactions
- Cognitive distortions and expressions of low self-efficacy for the task: “There’s no way I can pass.” “She knows I can’t write.”
- Difficulty concentrating

What do anxiety and depression look like in the classroom?

- Easily angered by changes in routine
  - High level of irritability (talking back, aggressive)
- Behavioral disruptions
  - These behaviors may be another attempt at avoiding exams, school work, or uncomfortable situations.
  - Behaviors may include walking out of the classroom, nervous tapping of pencil, etc.
- Falling asleep
- “Unmotivated” or hard to engage

Physical complaints that teachers might identify:
- Stomachaches
- Headaches
- Nausea
- Sweating
- Dry mouth
- Muscle tension
Obsessive Compulsive Disorder: Classroom Manifestations

- Be very neat, line up, or arrange things on my desk, in my backpack, or locker
- Check my desk, backpack, locker, or lunch bag again and again so I don’t forget something
- Finish my work perfectly so I check it and do it again if it’s not
- Do things over again if I get interrupted before I finish
- Not touch things that other kids have touched, like the ball in gym, or share pencils
- Walk through doors exactly the same way each time
- Bump into something again or on the other side of my body to make it feel equal

Case Illustrations

- Can help teachers visualize the symptoms (Moor et al., 2008)
- Examples appear in your handout.

4. Suggest Classroom Interventions

Research has found effective ways to manage and/or lessen anxiety and depression symptoms.
- Class and School-wide programs
- Individual Supports
Social Emotional Learning (SEL) Models

- “Free-standing lessons designed to enhance students’ social and emotional competence explicitly.
- Teaching practices such as cooperative learning and project-based learning, which promote SEL.
- Integration of SEL and academic curriculum such as language arts, math, social studies, or health.
- Organizational strategies that promote SEL as a schoolwide initiative that creates a climate and culture conducive to learning.

SEL Example: Strong Kids Curricula

- “. . . brief and practical social-emotional learning curricula designed for teaching social and emotional skills, promoting resilience, strengthening assets, and increasing coping skills of children and adolescents.
- Strong Start for grades K-2, Strong Kids for grades 3-8, Strong Teens for grades 9-12.
- http://strongkids.uoregon.edu/
- Pretest and posttest teacher ratings revealed significant decreases in students’ internalizing behaviors (Kramer, Caldirera, Young, Fischer & Warren, 2014). . .

Penn Resiliency Program (PRP)

- Teaches students to think more realistically and flexibly about the problems they encounter. PRP also teaches assertiveness, creative brainstorming, decision making, relaxation, and several other coping and problem solving skills.
- PRP reduces and prevents symptoms of depression. Of the 17 PRP studies, 15 examined PRP’s effects on depression symptoms. A meta-analysis of these studies revealed significant benefits of PRP at all follow-up assessments (immediately post-intervention as well as six and 12 months following the programme) (Brunwasser & Gillham, 2008).
- PRP reduces hopelessness. The meta-analysis also found that PRP significantly reduced hopelessness and increased optimism (Brunwasser & Gillham, 2008).” (Seligman, Ernst, Gillham, Reivich, & Linkins, 2009, p. 297)
Classroom CBT programs

- "...programs are more effective in the hands of mental health professionals or the program developers. ... Future research should focus on ways to improve the implementation of these programs by classroom teachers through increased specialist training and the provision of appropriate support materials." (Calear & Christensen, 2010)

- "Classroom based cognitive behavioural therapy programmes may result in increased self awareness and reporting of depressive symptoms but should not be undertaken without further evaluation and research." (Stallard, et al., 2012)

If Not Class-wide Models, Then What Other Classroom Interventions?

Individual accommodations or supports

1. Increase opportunities to respond and succeed
2. Model and reinforce positive coping behaviors
3. Understand and respond to cognitive distortions
4. Avoid negative strategies and build rapport (Huberty, 2006)
1. OPPORTUNITIES TO RESPOND ARE ESSENTIAL FOR LEARNING.
(MACSUGA-GAGE & SIMONSEN, 2015)

Yet, anxious or depressed students may retreat.

Adopt different response formats
- Individual dry-erase boards
- Ipad
- Polling apps
- Ask for good guesses instead of answers
- Think-pair-share
- Choose answer from a list
- Ask for the location, not the answer: “Where would we find this answer?”

Discussions
- Give a clear message about incorrect responses in discussions.
- Recognize partial answers.
- Allow “life-lines” (ask a friend)
- Give the anxious student the question in advance.
- Allow notes.
Classroom groups

- Allow students to work in different formats, not always in large and small groups.
- Allow students some choice about their partners in classroom activities.

Positive Peer Notes (PPN)

2. Model and reinforce positive coping strategies

- Build in 2-minute stress breaks to breathe deeply, doodle, draw, or listen to music.
- Let students listen to music while they work.
- Encourage students to move and stand for instruction if they choose (Crimine, 2018).
- Use stress balls and other stress relievers.
These are examples from the section, "When I first get to class."

- I might need more time getting started on my work.
- Help me avoid auditory distractions that may overwhelm me.
- Allow me to access my notes beforehand and be prepared for my knowledge to be used.
- Leave me at a distance of 1-2 meters to keep my attention.
- Plan for me to interrupt if necessary. Do I have the materials I need?
- Help me plan for my day and start all over.
- Have a mental health day with support. It’s one of the toughest parts of my day!
- Make time to say goodbye!
- Remember that I will probably run my family from being. Offer reassurance that I will follow.
- Have a smooth transition to breakfast with my peers.
- Let me still do my own schedule.
- Let’s keep something simple that makes me feel better (picture of my family, a small stuffed animal, etc.)

Ask the student what helps them.

Interventions for Test Anxiety

<table>
<thead>
<tr>
<th>Inform</th>
<th>Inform students of upcoming exams in advance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Review</td>
<td>Review test material with students</td>
</tr>
<tr>
<td>Allow</td>
<td>Allow students to study in groups</td>
</tr>
<tr>
<td>Support</td>
<td>Allow students the use of stress balls, music, etc., during exams</td>
</tr>
<tr>
<td>Perform</td>
<td>Perform a relaxation technique with the entire class prior to exams.</td>
</tr>
</tbody>
</table>

3. Help teachers understand and respond to cognitive distortions, including:

- Overgeneralization
- Disqualifying the positive
- Catastrophizing
- Personalization
- Should statements
- Comparing
- Selective abstraction
- Labeling (Huberty, 2012, p. 336)
Understanding perfectionistic thinking

1. "Dichotomous (all-or-none) thinking, wherein the student believes that a grade is either perfect or it is worthless."
2. Transforming desires (Wants) into demands (Musts). For example, a student who wants to do well on a test believes he or she must obtain a perfect score; otherwise they will view themselves as a failure.
3. Focusing on unmet goals and challenges rather than savoring successes. A student who gets a score of nine out of ten on an assignment dwells on the one missed point, rather than focusing on the overall high grade they received (Parker, 2000)."

How can teachers address perfectionism?

■ "Teach the student relaxation techniques to manage the physical response"
■ Teach the student how to identify his or her unhelpful automatic thoughts and counteract them with more helpful ones
■ Help the student see himself or herself through a less critical lens (Fisher & Kennedy, 2016).
■ CBT [or SFBT] can help to reframe the dichotomous (all-or-none) thinking that is typically characteristic of students struggling with perfectionism into a more accurate and healthy thought pattern (Pyryt, 2004)."

Understanding anxious adolescents’ interpretation of threats

■ "Children and adolescents with an anxiety disorder showed significantly higher levels of threat interpretation and avoidant strategies than non-anxious children and adolescents."
■ However, age significantly moderated the effect of anxiety disorder status on interpretation of ambiguity, in that adolescents with anxiety disorders showed significantly higher levels of threat interpretation and associated negative emotion than non-anxious adolescents
■ . . . a similar relationship was not observed among children."

(Walsh, Zelt, & Orness, 2015, p. 200)
Help teachers understand this anxiety cycle  
*(Beck & Clark, 1997; Mathews & Mackintosh, 2000)*  

- Anxious Individual  
- Attentional bias toward threats  
- Ambiguous Situation Seen As Threatening  
- Underestimates Ability to Cope  
- Physiological Distress  
- Avoid the Situation  
- Fail to Develop Self-Efficacy

**Actions to Avoid**

- **Teacher Words and Actions**  
  - Student reluctance  
  - Ask questions that lead to poor academic performance  
  - Lack of self-confidence  
  - Negative public or peer adult relationships  
  - Total academic withdrawal

**What not to do . . .**

- Set excessively high standards  
- Implement inflexible and rigid rules  
- Publicly reprimand the student  
- Use unpredictable grading criteria, changing deadlines, classroom protocols (example: Give “pop-quizzes”).  
- Make statements like “Look who decided to come to class!”  
- Enforce strict time limits during exams  
- Discourage the use of relaxation techniques or strategies  
- State directions once and refuse to review them  
- Punish the student for behaviors he/she may not be able to control
In conclusion

- "...a traditional mental health approach that emphasizes therapy to change the child’s behavior and cognitions often is not sufficient.
- Schools create conditions that may tend to trigger, cause, or exacerbate emotional and behavioral difficulties, but they also provide opportunities to treat and prevent the onset or worsening of problems.
- The importance of school-based interventions becomes more salient because many of the problems seen by community mental health providers are due to referrals by teachers and other school personnel." (Huberty, 2012, p. 324)
